

CALLING ALL PET PIG PARENTS

**African Swine Fever
hasn't yet spread in Canada.
Let's keep it that way.**

African Swine Fever (ASF) is a viral infection with a **very high risk of fatality for pigs.**

- There is **no treatment or vaccine** for ASF, so prevention is critical!
- ASF is **highly resistant in the environment** and can be transmitted through direct or indirect contact with infected pigs or pork products.
- ASF **cannot be transmitted from pigs to humans** and is not a food safety risk.

Always keep a look out for signs of ASF in your pigs, including:

Fever,
weakness, or
low appetite

Vomiting
and/or
diarrhea

Coughing
or difficulty
breathing

Red, blotchy
skin or skin
lesions

Sudden
abortions or
death

There are some simple things you can do to protect your pigs from ASF:

Never feed any type of meat to your pigs, including dog or cat food. If you feed your pig table scraps, **boil scraps for 30 minutes** first.

Do not allow your pig to have contact with **wild pigs or domestic pigs from other households**.

Avoid contact between your pig and visitors, especially if visitors have been in contact with other pigs.

Keep your pig's environment clean and wash your hands frequently, especially when handling your pig or their food.

NOT IN OUR
BACKYARD!

ASF is a reportable disease in Canada. Remember to stay vigilant and contact your veterinarian promptly if your pigs are unwell.
