

DO YOU KEEP AND RAISE PIGS

African Swine Fever
hasn't yet spread in Canada.
Let's keep it that way.

African Swine Fever (ASF) is a viral infection with a **very high risk of fatality** for pigs.

- There is **no treatment or vaccine** for ASF, so prevention is critical!
- ASF is **highly resistant in the environment** and can be transmitted through direct or indirect contact with infected pigs or pork products.
- ASF **cannot be transmitted from pigs to humans** and is not a food safety risk.

Always keep a look out for signs of ASF in your pigs, including:

Fever,
weakness, or
low appetite

Vomiting
and/or
diarrhea

Coughing
or difficulty
breathing

Red, blotchy
skin or skin
lesions

Sudden
abortions or
death

There are some simple things you can do to protect your pigs from ASF:

Never feed any type of meat to your pigs, including dog or cat food. **This is prohibited by law in Canada.**

Avoid visitors near your pigs and have **clean, disinfected and dedicated equipment** for pigs. Remember to **wash your hands often.**

If you feed your pigs table scraps, **boil them for 30 minutes** and cool them down before feeding.

Secure your pig pen to **prevent your pigs from interacting with wild pigs.**

NOT IN OUR
BACKYARD!

ASF is a reportable disease in Canada. Remember to stay vigilant and contact your veterinarian promptly if your pigs are unwell.
